

# When it comes to tooth decay, you and your family have a choice.

Our practice provides **Curodont™**, a needle-free, drill-free treatment for early decay **BEFORE** it becomes more serious.

**Curodont™**  
Repair Fluoride Plus

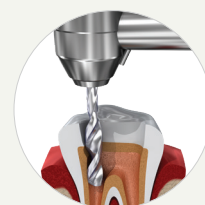

## What happens when early decay is left untreated?

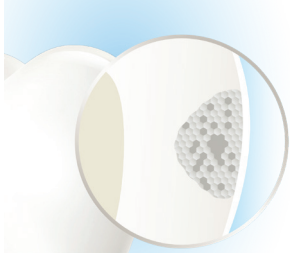

When left untreated, early decay can progress and cause extensive, irreversible damage to the tooth structure and risk of severe diseases.

Their small cavity progression will require invasive treatments: drilling & filling.

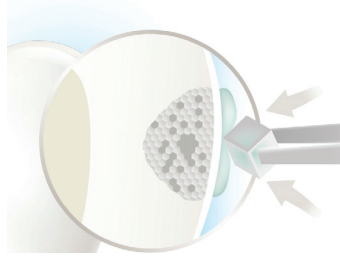

Restorative treatments such as fillings, do not last forever. If they fail, a more invasive procedure may be necessary – including a root canal or dental implant.

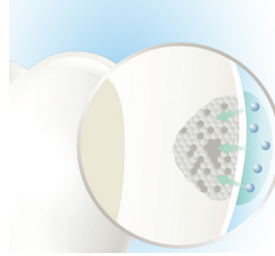

# Choose Curodont™ the simple, effective, drill-free, early decay treatment.

Early decay forms beneath the tooth surface.

The dental professional applies Curodont™ Fluoride Plus in office.

The formulation diffuses throughout the enamel.

Mimicking nature, Curodont™ treats the early lesion by restoring the lost minerals with the minerals from your own saliva.

## Benefits of Applying Curodont™

- ✓ No drilling or injection needed
- ✓ One-time application, fast & easy in under 3 min
- ✓ Non-staining
- ✓ For permanent & primary teeth
- ✓ Tasteless
- ✓ Suitable for everyone
